

MINI PROJECT REPORT

PERSONAL PORTFOLIO WEBSITE

A Responsive Multi-Page Professional Web Application

Student Details:

- **Name:** Kamali E
- **Role:** Aspiring Full Stack Developer
- **Technologies Used:** HTML5, CSS3, JavaScript
- **Hosting Platform:** GitHub Pages

1. INTRODUCTION & OBJECTIVES

A personal portfolio website serves as an essential digital profile for an aspiring software engineer. This project introduces a fully responsive, clean, and modern multi-page portfolio built completely from scratch. The main goal is to show general information, skills, previous project work, and contact details in an elegant, minimal user interface.

The core design choice focuses on a professional light grey background (#f5f5f5) mixed with crisp white content containers and high-contrast dark accents (#111111) to provide clean visibility and seamless cross-platform reading.

2. SYSTEM WEBSITE PAGES

The application is broken down into three primary static components connected through a fixed sticky navigation system:

- **Home Page (index.html / home.html):** Highlights the primary professional tagline, a personal summary bio description, structured skills listed clearly, and an adjustable circular user profile frame.
- **Projects Page (project.html):** Features details of built real-world solutions. Each item highlights target goals, code-base technology stacks, external project file download parameters, and live repository linkages.
- **Contact Page (contact.html):** Provides a dual-column layout containing structural text profiles (Email, Phone, LinkedIn, GitHub URLs) side-by-side with an operational message entry form box.

3. VISUAL ARCHITECTURE (OUTPUT PREVIEWS)

The following sections visualize the precise layout outputs generated by your code structure across your application directories:

3.1 The Home Viewport Interface

Figure 1: Home Page View with Bio details and Circular Profile Positioning

3.2 The Projects Log Interface

Figure 2: Project Presentation Viewport Layout with Download Callouts

3.3 The Contact Details & Messaging Form Interface

Figure 3: Split-Pane Contact Information & Active Input Form View

4. CORE STYLING SUMMARY (CSS SETTINGS MATRIX)

To keep the website neat and structured, several important design properties were defined inside the style headers:

CSS Selector Target	Applied Layout Setting	Purpose & Behavioral Result
.navbar	display: flex; position: sticky;	Locks the menu bar to the top of the browser screen while reading.
.container	display: flex; gap: 60px;	Aligns text narrative data and the round picture box side-by-side cleanly.
.profile	border-radius: 50%; object-fit: cover;	Cuts any regular square image source into a perfect smooth circle.
.file-box	border: 2px dashed #ccc;	Creates a clear dashed area highlighting downloadable project contents.

5. PROJECT CONCLUSION

The code successfully crafts a clean, polished, multi-page portfolio system tailored for professional visibility. By utilizing modular CSS properties like Flexbox layouts and sticky header menus, the web pages present Kamali E's development skills, technical mini-projects, and connection details in a clean, professional, and accessible format.
